
MK147 MASTER CANON

DIMENSIONAL RINGS

LOCKED-IN SERIES VERSION

v1.0

STATUS:

LOCKED

PURPOSE:

**Provide expedition-scale storage and retrieval without
requiring inventory bookkeeping while remaining consistent
with MK147's Genesis, Identity, Configuration Space,
Collapse, and Recursive Topology framework.**

FOUNDATIONAL PHILOSOPHY

Dimensional Rings are NOT:

- **Pocket dimensions**
- **Infinite inventories**
- **Inventory menus**
- **Operating systems**

- **Storage databases**

- **User interfaces**

Dimensional Rings ARE:

A practical civilization-scale application of:

- **Configuration Space**

- **Conscious Selection**

- **Collapse Resolution**

- **Recursive Topology**

- **Information Conservation**

The ring does not "store objects."

The ring conserves the object's identity and topology

through recursive persistence.

The object never ceases to exist.

Its inheritance simply changes.

HIGH-LEVEL MODEL

Energy

Expand Configuration Space

Consciousness

Select Topology

Collapse

Reassign Inheritance

Recursive Topology

Maintain Persistence

Information

Conserved

STORAGE OPERATION

Example:

Room

↓

Contains Pillow

The pillow currently inherits:

Room

The user activates the ring.

Genesis Energy is supplied.

**The ring expands its accessible
configuration space.**

**The pillow becomes accessible within
the expanded configuration domain.**

The user consciously selects:

Pillow

Collapse resolves.

Inheritance changes.

Before:

Room

└─ Pillow

After:

Ring

└─ Pillow

The pillow no longer inherits the room.

The pillow now inherits the ring.

The pillow is stored.

RETRIEVAL OPERATION

The inverse operation.

The user activates the ring.

The user selects:

Pillow

Collapse resolves.

Inheritance changes.

Before:

Ring

└─ Pillow

After:

Environment

└─ Pillow

The pillow becomes physically accessible.

No object movement occurs in the traditional sense.

Only inheritance changes.

RECURSIVE TOPOLOGY

The ring does not contain a physical volume.

The ring maintains a recursively stabilized topology.

Stored objects persist through:

Recursive Topological Conservation

**The ring is fundamentally an information
conservation device.**

The ring conserves:

- Identity
- Structure
- Topology
- Relationships

CONFIGURATION SPACE EXPANSION

**Genesis Energy determines the maximum
accessible configuration radius.**

More energy

=

Larger accessible configuration space

The ring expands outward into the environment.

Objects within the expanded configuration

space become available for selection.

Example:

Object 3 feet away

Low energy required.

Object 20 feet away

Higher energy required.

Object 30+ feet away

Significant energy required.

RING QUALITY

**Ring quality determines the maximum
configuration-space projection radius.**

Example progression:

Red Ring

≈ 3 feet

Orange Ring

≈ 5 feet

Yellow Ring

≈ 7 feet

Green Ring

≈ 11 feet

Blue Ring

≈ 17 feet

Violet Ring

≈ 23 feet

White Ring

$\approx 31+$ feet

Exact values remain adjustable.

The principle is locked.

Higher quality rings can interact with
larger portions of the environment.

WHY RINGS?

Civilization converged on rings because they are:

- Always worn
- Always accessible
- Difficult to lose
- Lightweight
- Durable
- Hands-free
- Expedition-friendly

Alternative forms may exist:

- Cubes
- Necklaces
- Bracelets

- Talismans

However:

Rings became the civilization standard.

The same way wheels became standard.

Not because alternatives are impossible.

Because rings are the most practical solution.

CONSCIOUS RETRIEVAL

The ring does NOT maintain an inventory menu.

The ring does NOT provide a user interface.

The ring does NOT provide object lists.

Retrieval operates through:

Conscious Recognition

**Stored objects develop recognizable
topological identities.**

Users learn those identities over time.

The experience resembles:

Searching a pocket for keys.

You do not read a list.

You recognize the object.

Retrieval is:

Recognition

Not Search

NOVICE USERS

A novice user may struggle to locate items.

Example:

Stored:

- **Rope**
- **Lantern**
- **Tent**
- **Medical Kit**

Novice retrieval:

"Where is the rope?"

Slow.

Inconsistent.

Requires familiarity.

EXPERT USERS

**A veteran user becomes familiar with the
stored topologies.**

Retrieval becomes nearly instantaneous.

Example:

Need Rope

Recognize Rope

Retrieve Rope

Done.

The ring did not improve.

The user improved.

JENKINS PRINCIPLE

Canonical Example:

Jenkins stores:

- **Rope**
- **Lantern**
- **Shovel**

- Fishing Pole
- Cooking Pot
- Bridge Sections
- Random Junk

Months later:

Group reaches 300-foot chasm.

Jenkins says:

"I know I packed rope."

Retrieval begins.

Out comes:

Lantern

Pot

Shovel

Fishing Pole

Another Shovel

Chair

Wheel

Everybody groans.

Eventually:

Rope

The ring functioned perfectly.

Jenkins did not.

This establishes:

The ring reflects the organizational habits

of its owner.

The ring is not a database.

The ring is an extension of the user.

EXPEDITION ROLE

Dimensional Rings exist to remove

bookkeeping logistics.

They preserve meaningful logistics.

The reader should care about:

- **Which route?**
- **Which supplies?**
- **Which solution?**
- **Which obstacle?**
- **Which expedition?**

The reader should NOT have to care about:

- **Who carries rope #4**
- **Exact pack weight**
- **Inventory accounting**

Dimensional Rings remove paperwork.

They preserve decisions.

CIVILIZATION IMPACT

Dimensional Rings are foundational
expedition infrastructure.

Equivalent importance:

- Maps
- Lanterns
- Climbing Gear
- Genesis Crystals

Professional delvers are expected
to possess one.

Higher quality rings are major investments.

Many delvers spend their first serious earnings
upgrading their ring.

ARCHITECT UNDERSTANDING

Common Delver:

"Storage Ring."

Scholar:

"Configuration-space storage."

Architect:

**"Conserved recursive topology through
configuration-space expansion and
inheritance reassignment."**

FINAL LOCK

Dimensional Rings are not inventory systems.

Dimensional Rings are not pocket dimensions.

**Dimensional Rings are recursive-topology
conservation devices.**

Storage:

Expand → Select → Collapse → Conserve

Retrieval:

Recognize → Select → Collapse → Retrieve

Simple manifestation.

Sophisticated structure.

LOCKED.
